

Example 2 — Price Pulse Demand Response (row-normalised kernel)

$$F(\mathbf{x})(t) = X_1 \mathbf{1}_{[0.5, 1.0)}(t) + X_2 e^{-(t-2)^2/4.5} + X_3, \quad \mathbf{x}^* = (0.9, 0.7, 0.6)$$

Identity

Causal ($\ell = 0.33h$)

Gaussian ($\sigma = 0.3h$) ✗

**t = 0.3 h
(pre-pulse)**

**t = 0.75 h
(in pulse)**

**t = 1.5 h
(post-pulse)**

**t = 2.5 h
(later)**

Time-aggregated importance (ranking preserved across kernels)
